Prediction Probabilities

Alzheimer : 0.00%

Multiple Sclerosis : 0.62%

Normal : 99.38%

Stroke : 0.00%

Tumor : 0.01%

Disease Overview

A Normal brain MRI indicates that no significant abnormalities associated with Alzheimer's disease, Brain Tumor, Stroke, or Multiple Sclerosis were detected by the BrainInsight AI model. A normal MRI generally suggests healthy brain structures without visible pathological changes. However, MRI findings should always be interpreted by a qualified healthcare professional alongside clinical examination.

General Treatment

No treatment is required when the MRI is classified as normal. If neurological symptoms persist despite a normal MRI, consult a neurologist for further clinical evaluation and additional diagnostic tests if necessary.
